Ozone Injections

Ozone injections for pain relief and tissue repair:

ozone is created for medical purposes with an ozone generator that takes medical grade oxygen and exposes it to an electrical spark. This creates singlet oxygen ions, which then attach themselves to two O₂ molecules to create two O₃ molecules. The ozone gas can then be drawn into a syringe to be used for an injection to any part of the body that deals with chronic inflammation and/or pain.

Ozone injections can be used for chronic neck pain, low back pain, shoulder pain, elbow pain, hip pain, jaw pain, carpal tunnel syndrome, and can even be injected at any trigger point for pain relief. Ozone can essentially be injected into any joint and or muscle without difficulty. According to the scientific studies out of Germany, 1--5 injections separated 2 weeks apart should render any patient pain free at the site of injection. Virtually all musculoskeletal aches and/or pains that have persisted for over 2 months will respond ozone injections.

Pain relief is usually complete within 30-60 minutes post injection. It works by the mechanisms described above. That is by increasing oxygen uptake in the local tissue and speeding up local metabolism, which accelerates repair processes. Unlike steroids such as cortisone shots, which provide anti-inflammatory effects, but we can the injected tissue due to its catabolic effects, ozone stimulates repair processes that promotes healing of the injured tissue and subsequently decreases the inflammation without negative side effects!
